Robust Universal Lathe Stand

The Robust **Universal Stand** is the most adjustable, adaptable lathe stand on the market. The Robust Scout, a 14" lathe bolts directly on. By using an adapter board provided by the user, any small lathe can fit.

The **Universal Stand** can raise the lathe up for a tall standing turner or dropped down and tipped forward to accommodate a seated turner.

The Universal Stand goes together quickly and easily with just two tools, a 1/2" wrench and a 9/16" wrench. All hardware to assemble the stand is included.

If used for any other lathe than the Robust Scout, additional hardware will be needed to attach your adapter board to the stand and to attach your lathe to the adapter board. For the adapter board, a solid clear 2 x 10 is recommended, or two pieces of quality 3/4" plywood laminated together works well too.

A three-caster set up is available for the Universal Stand. Once installed, no tools are needed to engage and disengage the casters. There are two straight casters that go on the headstock end and a swivel caster that goes on the tailstock end.

The Universal Stand can fit almost any small or mid-sized lathe with user-supplied adapter boards. Robust's 14" Scout lathe bolts on directly .

The Universal Stand height can be adjusted for almost any turner, short or tall (Apr. 38-50" spindle heights). The stand

will also lower and tip forward up to 30° for a seated turner.

Assembles with just two wrenches. Tool racks are built in. Casters are optional.
